

JAMES OKOOBOH

DevOps & Cloud Engineer | AWS | Kubernetes | Terraform | Cloud Security | Full-Stack Deployment | IaC

Lagos, Nigeria • jamesokooboh56@gmail.com • github.com/Jamesokooboh • linkedin.com/in/jamesokooboh • Portfolio: gamma.app

PROFESSIONAL SUMMARY

Cloud & DevOps Engineer with hands-on experience architecting and deploying cloud-native infrastructure on AWS, including container orchestration with Kubernetes on Amazon EKS and Amazon ECS Fargate, and Infrastructure-as-Code automation with Terraform. Has shipped full-stack applications end-to-end, from Node.js and Java/Spring services through to production-style deployment pipelines backed by GitHub Actions CI/CD, Amazon RDS, and Prometheus/Grafana observability. Also brings hands-on full-stack web development experience, including a live client website with integrated ordering. Actively pursuing AWS Certified Solutions Architect – Associate to complement extensive project experience. Seeking Cloud Engineer, DevOps Engineer, Platform Engineer, or Site Reliability Engineer roles.

CORE COMPETENCIES

CI/CD Pipeline Design & Automation • Infrastructure as Code (Terraform) • Container Orchestration (Kubernetes / EKS / ECS Fargate) • AWS Cloud Architecture • Monitoring & Observability • Serverless Architecture • VPC Networking & Security Groups • IAM Policy Design • Full-Stack Web Development • Cost Governance & Optimization • Linux & Bash Scripting • GitOps (ArgoCD)

TECHNICAL SKILLS

Cloud Platforms: AWS — EC2, S3, IAM, VPC, Subnets, Security Groups, Route 53, RDS, CloudWatch, Lambda, SNS, SQS, DynamoDB, API Gateway, Cognito, EKS, ECS (Fargate), ECR, CloudFront, ACM, Secrets Manager

IaC & Automation: Terraform, Bash Scripting, GitHub Actions

Containers & Orchestration: Docker, Kubernetes, Amazon EKS — Deployments, Services, Ingress, IRSA/OIDC; Amazon ECS on Fargate; ArgoCD (GitOps continuous deployment)

CI/CD: GitHub Actions — build, containerize, push to ECR/GitHub Packages, deploy

Application Development: Node.js, Java 17 / Spring (Core, Web, WebMVC), Maven, HTML/CSS/JavaScript, Supabase

Databases: MySQL (Amazon RDS), Supabase (PostgreSQL)

Monitoring & Observability: Prometheus, Grafana, AWS CloudWatch — log aggregation, alerting, dashboards

Networking: VPCs, Subnets, Security Groups, DNS, Application Load Balancers, Route 53

Other: Git, Linux (Ubuntu/RHEL), Serverless Architecture, Technical Training & Mentoring

CERTIFICATIONS

- DevOps & Cloud Engineering Internship Certificate – Miseacademy, August 2026

PROFESSIONAL EXPERIENCE

DevOps & Cloud Engineering Intern | Miseacademy | Remote

August 2026

- Designed and deployed production AWS infrastructure (EC2, RDS, S3, CloudFront, ACM, IAM, Secrets Manager) for a live e-commerce application serving real users on a custom domain.
- Automated multi-environment infrastructure provisioning with Terraform, including remote state management via S3 and DynamoDB locking.
- Containerized and orchestrated the application with Docker and Kubernetes, implementing GitOps continuous deployment with ArgoCD.
- Built a monitoring and alerting stack combining AWS CloudWatch, Prometheus, and Grafana across infrastructure and application layers.
- Diagnosed and resolved live production incidents, including cross-origin request failures, silent upload timeouts, and a false-positive alerting bug, tracing each to root cause rather than patching symptoms.

Cloud Engineering Instructor | Independent Training Program | Lagos, Nigeria

2025 – Present

- Designed and delivered a structured AWS and Linux cloud engineering curriculum for a cohort of 5 students, covering IAM policy design, EC2, S3, VPC networking, subnets, security groups, RDS, Route 53, CloudWatch, and static website hosting.
- Built and guided students through real-world cloud deployment labs on live AWS environments, accelerating practical proficiency from zero to functional cloud deployments within the program timeline.
- Simplified complex networking and security architecture concepts (VPC peering, security group chaining, NACL rules) through visual walkthroughs, tracked via lab assessments.
- Produced reusable training materials, lab guides, and runbooks that standardized instruction delivery for future cohorts.
- Mentored students on IaC principles using Terraform, reinforcing best practices around modularization, remote state, and variable abstraction.

KEY PROJECTS

E-Commerce Platform on AWS with GitOps Deployment | *Tech Stack: AWS (EC2, RDS, S3, CloudFront, ACM, IAM, Secrets Manager) · Docker · Kubernetes · ArgoCD (GitOps) · Terraform · CloudWatch · Prometheus · Grafana*

- Designed and deployed production AWS infrastructure (EC2, RDS, S3, CloudFront, ACM/SSL, IAM, Secrets Manager, Route 53) for a live e-commerce application running on a custom domain with real users.
- Automated infrastructure provisioning across 5 environments with Terraform, including remote state management via S3 and DynamoDB locking.
- Implemented GitOps continuous deployment with ArgoCD on a Kubernetes cluster, decoupling application deployment from the CI pipeline.
- Built a monitoring and alerting stack combining AWS CloudWatch, Prometheus, and Grafana across infrastructure and application-level metrics.
- Diagnosed and resolved live production incidents, including cross-origin request failures, a silent upload timeout, and a false-positive alerting bug, tracing each to root cause.

Job Application Tracker | *Tech Stack: AWS, Terraform, Docker, GitHub Actions · github.com/Jamesokooboh/Job-Tracker*

- Designed and deployed a FastAPI + PostgreSQL service to AWS ECS Fargate using Terraform, provisioning VPC, ALB, RDS, IAM, and CloudWatch alarms from scratch with no manual console changes.
- Built a GitHub Actions CI/CD pipeline using OIDC federation for AWS auth (zero long-lived credentials), gated by automated tests and a manual production-approval step before infrastructure changes apply.
- Diagnosed and fixed real deployment failures — an IAM trust-policy mismatch against GitHub's OIDC token claims, an IAM least-privilege gap blocking role creation, and a CI/CD bootstrap ordering bug — verified via a live end-to-end deploy, then tore down cleanly.
- Locked down the network path (no public IPs on app/DB, security groups chained ALB→ECS→RDS) and kept secrets out of the repo entirely via AWS Secrets Manager.

Full-Stack Web Application Deployment on Amazon EKS | *Tech Stack: Node.js · MySQL (Amazon RDS) · Docker · Kubernetes (EKS) · Terraform · GitHub Actions · Prometheus · Grafana*

- Built and deployed a full-stack Node.js restaurant application with a MySQL data layer, containerized with Docker and deployed to Amazon EKS using Kubernetes Deployments, Services, Ingress, and Secrets.
- Automated the release process end-to-end with GitHub Actions: builds the Docker image, pushes to Amazon ECR, updates the EKS kubeconfig, applies manifests, and rolls out the new deployment on every merge.
- Provisioned the full supporting infrastructure with Terraform — custom VPC, EKS cluster with managed node group, ECR repository, and an Amazon RDS MySQL instance.
- Instrumented the application with /health and /metrics endpoints, scraped by Prometheus and visualized in Grafana for real-time service health and request-volume monitoring.

Containerized Java Web Application on Amazon ECS Fargate | *Tech Stack: Java 17 · Spring · Maven · Docker · Amazon ECS (Fargate) · Application Load Balancer · Terraform · CloudWatch*

- Deployed a Java 17 / Spring MVC web application (built as a WAR with Maven) to Amazon ECS on Fargate, removing the need to manage or patch underlying EC2 instances.
- Configured an Application Load Balancer to route traffic into the Fargate service, running within a custom VPC with public and private subnets.
- Defined the ECS task definition (1 vCPU / 3GB memory, awsvpc networking) and wired centralized logging to CloudWatch via the awslogs driver.
- Set up Maven-based CI to publish build artifacts to GitHub Packages as part of the deployment workflow.

Serverless Event-Driven Architecture | *Tech Stack: AWS Lambda · API Gateway · Amazon Cognito · S3 · SQS · DynamoDB · SNS · Terraform · GitHub Actions · CloudWatch*

- Designed and deployed a fully event-driven serverless platform: API Gateway, secured with Amazon Cognito, triggers Lambda functions for synchronous requests, alongside an asynchronous file-processing pipeline.
- Built a decoupled, fault-tolerant workflow — S3 upload → SQS (with dead-letter queue) → Lambda → DynamoDB → SNS email notification — providing retry safety and burst smoothing.
- Managed all infrastructure through Terraform, deployed via a GitHub Actions CI/CD workflow, with CloudWatch logs and alarms for operational visibility.

ADDITIONAL INFORMATION

- Full-stack web development: designed and shipped a responsive business website (Benom Cakes N More) for a bakery client, featuring WhatsApp-integrated ordering and a Supabase backend foundation for upcoming dynamic features.
- Actively expanding Cloud and DevOps project portfolio to demonstrate hands-on depth across AWS, Kubernetes, and platform engineering.
- Strong interest in contributing to high-performing engineering teams focused on AWS, Kubernetes, and scalable infrastructure automation.
- Open to Cloud Engineer, DevOps Engineer, Site Reliability Engineer, Platform Engineer, and Full-Stack Engineer opportunities — remote and on-site.
